

Final Tables' Report

Candidate size increase from 500 to 5000 helps in improving candidate recall from 36.6% to 60.6%.
However, nDCG@10 stays completely flat, showing the strong need for a reranking downstream model. (from table 1).

Both Hybrid BGE-M3 and Hybrid SBERT provide the most accurate results since they obtain the largest nDCG values in almost all cases. All hybrid models show outstanding results compared to the basic BM25.
Hybrid models (SBERT/BGE-M3) yield statistically significant. (from table 2 and 3)
